Patent No. 6204013
GENERAL INFORMATION:
APPLICANT: Khodadoust, Mehran
TITLE OF INVENTION: NOVEL MSP-5 PROTEIN AND NUCLEIC ACID MOLECULES
TITLE OF INVENTION: NOVEL MSP-5 PROTEIN AND NUCLEIC ACID MOLECULES
NUMBER OF SEQUENCES: 4
CORRESSORDENCE ADDRESS:
ADDRESSE: ADDRESSE:
ADDRESSE: LAHIVE & COCKFIELD, LLP
STREET: 28 State Street
CITY: Boston
STATE: Massachusetts
COUNTRY: USA
ZIP: 02109
COMPUTER: IBM PC COMPATION:
MEDIUM TYPE: Floppy disk
COMPUTER: IBM PC COMPATION
OFFWARE: Patentin Release #1.0, Version #1.25
SOFTWARE: Patentin Release #1.0, Version #1.25
CURRENT APPLICATION NUMBER: US/09/163,285
FILING DATE:
CLASSIFICATION NUMBER: US/09/163,285
FILING DATE: June 24, 1998
ATTORNEY/AGENT INFORMATION:
PRICE RENCE/DOCKET NUMBER: MNI-049
TELECOMMUNICATION INFORMATION:
TELEPHONE: (617)747-400
TELEPHONE: (617)727-7400

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Onote-"Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; 1st strand cDNA was prepared from mammary gland tissue from a lactating female, and was then primed with a Not I - oligo(dT) primer. Double-stranded cDNA was ligated to Eco RI adaptors (Pharmacia), digested with Not I and cloned into the Not I and Eco RI sites of the modified pT7T3 vector. Library is normalized. Library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      nmalia; Eutheria; (bases 1 to 588)
                                                                                                                                              149
                                                                                                                                  Jobber 2007 Noti; The poly (A)+ RNA was decapped with tabacco acid pyrophosphatase (TAP) and ligated with DNA-RNA linker including EcoRI site by treatment of T4 RNA 11gase. The first strand cDNA was synthesized from oligo dT-selected mRNA by priming with dT-tailed vector. The dT-tailed vector was adjusted to have about 60nt. The cDNA vector was circularized with E. coli DNA ligase after digestion of EcoRI which site is also included in vector. An RNA strand converted to a DNA strand by Okayama-Berg method. The obtained cDNA vectors were used for transformation of competent cells E. coli ToplOf' by electroporation method. After analyzing and sequencing about 2,000 - 3,000 colonies in original cDNA library, the abundant cDNAs were selected and amplified by PCR reaction using vector region primer including T7 promotor as 5 primer and N(dT)14 as 3' primer. The PCR products were used as template for synthesis of biotinylated single stranded RNA by in vitro transcription reaction. The synthesized RNA probes were hybridized with antisense single stranded RNA probes were hybridized with antisense single stranded cDNAs prepared from original liberary and incubated with avidin gel. After removing DNA-RNA hybrids by centrifuge, the subtracted cDNA libraries were constructed by transformaion of the remaining DNA into competent cells E. coli ToplOf' with electroporation method."

EST's are made from clones being representatives of clone clusters.

Clone clusters were calculated from oligonucleotide fingerprints.
                                                                                                                       Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Eutele Mammalia; Eutheria; Rodentia; Sciurognathi; Muridae; Muril 1 (bases 1 to 802)
Yahyawi,M., Hennig,S., Neidhardt,L., Radelof,U., Hermann,I Lehrach,H. and O'Brien,J.
Detection of a high number of novel genes in a 9-day mouse CDNA library normalised by oligonucleotide fingerprinting

/note="Vector: p773D-Pac (pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; UI-R-EB1 is a non-normalized Rat Duodenum library (RDU) constructed in p73T7 PAC vector according to the procedure described by Bonaldo, Lennon & Soares (Genome Research Genome 6: 791-806, 1996). The oligonucleotide used to prime first strand synthesis contained the sequence tag TGTGGTTCAT between the Not I cloning site and dT18 stretch. The Rat Deuodenum tissue was provided by Tom Freeman of the Sanger
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            /strain="Sprague-Dawley"

The sequence contained an oligo-dT track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail The sequence tag present in the cDNA between the NotI site
and the oligo-dT track served to verify it as a clone from the
normalized cartilage library cDNA Library Preparation: M.B. Soares
Lab Clone distribution: clones will be available through Research

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             primer: M13 Forward
                                                                                                                                                                /note-*Organ: Femur and Tibla; Vector: pT7T3D-Pac (Pharmacia) with a modified polylinker; Site_1: Not I; Site_2: Eco RI; UI-R-DYI is a normalized cDNA library containing the following tissue(s): Rat Cartilage from Femur and Tibla. The library was constructed according to Bonaldo, Lennon and Soares, Genome Research, 6:791-806, 1996. First strand cDNA synthesis was primed with an oligo-dT primer containing a Not I site. Double stranded cDNA was ligated to an EcoR I adaptor, digested with Not I, and cloned directionally into pT7T3-Pac vector. The oligonucleotide used to prime the synthesis of first-strand cDNA contains a library tag sequence that is located between the Not I site and the (dT)18 tail. The sequence tag for this library is CTAATGGACG. The Rat cartilage tissue was provided by Dr Jeff Stevens at the

The sequence contained an oligo-dT track that was present in the
oligonucleotide that was used to prime the synthesis of first
strand cDNA and therefore this may represent a bonafide poly A
tail. The sequence tag present in the cDNA between the NotI site
